Idea:

Technology Assistant for Patient Care (Includes Google Alexa Help Support)

During an emergency case, a patient requires urgent help but he/she is unable to call for help because of the worse conditions. At that time, "Technology Assistant" will come into play.

We will be training the Alexa by entering several keywords in it. As soon as Alexa will recognise those keywords, it will call for help immediately for the patients.

It will also ask for the various conditions and enable the patients to come in direct contact with a doctor for help.

Nowadays, to talk to Alexa, we press button but with the "Technology Assistant" it will be possible to talk to it by just speaking those keywords. Nearby hospitals can be contacted and ambulance can be called.

Therefore, the assistance will be provided even more faster and many more lives can then be saved.
